<center>Final Project Proposal</center>

For my final project I wanted to make a website that was meant to emulate a place where people can look at, purchase and read descriptions of different clothing items from my closet. When you hover across the different photos I want each item to be zoomed and I'd like to be able to create a website that is like a personal Depop page. I can create different pages which are different categories of clothing that I have whether it be t-shirts, jackets, hats etc. I've always been interested in fashion and have witnessed how brands can use their website as a means of showcasing their own personality so I wanted to make this final project showing how a website can portray clothing being an extension of yourself. The concepts and themes prevalent are self-expression through fashion and digital archiving of physical wardrobe.

Site Structure & Pages

- "My site will include at least three HTML pages:"

- Home Page: Overview of the collection, intro to the theme

- Category Page (e.g., T-Shirts): Grid of clothing items

- Item Detail Page: Description, material, year

Semantic HTML Structure:

- <header>, <nav>, <main>, <section>, <article>, <footer>

CSS Styles, Layout, and Fonts

- I'll be using Google Fonts to reflect my style—something like Manrope or Playfair Display

CSS Features:

- Custom styles for each clothing category (different background colors, textures)

- Hex color palette to keep things cohesive (e.g., muted earth tones or washed pastels)

- Use of Flexbox and Grid to lay out image galleries and responsive design

Design Cohesion:

- Consistent typography across pages

- Hover interactions and zoom effects unify the browsing experience

- Soft drop shadows and sharp corners

Animation & Interaction

- I'll incorporate CSS animations for hover zooms, fading transitions, and smooth scrolling. Each clothing image will zoom slightly when hovered over.

JavaScript / jQuery Ideas:

- Clicking on an item brings up a pop-up with item details

- jQuery to toggle category menus, hover effects, or dynamically load content

p5.js Integration:

- Abstract background art that shifts subtly based on mouse movement

- Maybe even sketchy outlines that animate around clothing pieces

Dynamic Content

- "Sold out" indicators

- Maybe an item slideshow or carousel

- A Favorites feature
